

Automatic Generator Start - Auto Gen Start (AGS):

Auto Gen Start continuously monitors the power system and can start the generator if the battery voltage or the state of charge reaches preset limits. Auto Gen Start can be used to start the generator and assist the inverter/charger when power demands are high. When properly configured, Auto Gen Start ensures that all power requirements are met and that the batteries stay charged.

Auto Gen Start enables manually starting and stopping the generator. There are a number of settings which must be configured to ensure that the generator automatically starts and stops under the right conditions and at the right time. Many of these settings have been programmed at the factory. Only the AGS Mode and Quiet Time will need to be configured.

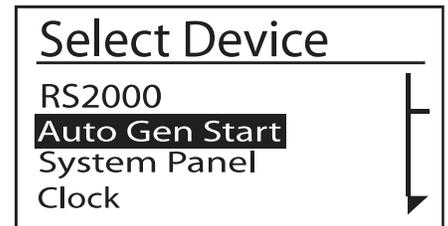

The AGS Mode enables either automatic or manual control of the generator. In the Automatic Mode, the generator can start and stop automatically in response to low battery voltage, low battery state of charge, AC loads on the inverter, or exercise time. Automatic mode also uses a Quiet Time feature, which prevents the generator from starting during evening hours or other inconvenient times.

WARNING:

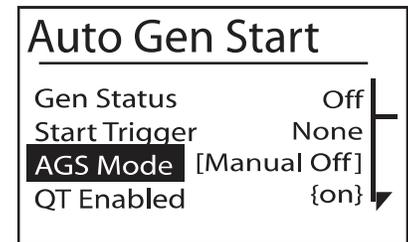

Running a generator in an enclosed space produces potentially lethal exhaust gases. Prior to storing the motorhome, disable the Auto Gen Start by placing the system in the Hibernate mode. The generator connected to Auto Gen Start should not otherwise be left unattended.

Use the buttons on the System Control Panel to perform three basic steps to change the Auto Gen Start setting:

1. View the Select Device menu.
2. Select the Auto Gen Start from the Select Device menu.
3. Select and adjust a changeable setting on the Auto Gen Start menu.
